Severity & Case Classification

Name: Palak Shrivas

Objective: To classify adverse drug reactions based on seriousness and expectedness, and to evaluate multiple cases to determine their clinical impact using pharmacovigilance guidelines.

Case	Drug	Adverse Reaction	Seriousness	Expectedness	Reason
01	Amoxicillin	Skin rash	Non-serious	Expected	Rash is a common, labelled reaction to penicillins; no hospitalization or life-threatening outcome.
02	Ibuprofen	Gastrointestinal reaction requiring medical intervention	Serious	Expected	GI bleeding/ulceration is a known NSAID effect; medical intervention makes it serious.
03	Metformin	Lactic acidosis	Serious	Expected	Life-threatening, needs emergency care; it is a boxed warning in the label.
04	Atorvastatin	Elevated liver enzymes (mild)	Non-serious	Expected	Mild rise in transaminases is listed for statins; no serious outcome.

Summary: Cases 02 and 03 are serious and expected. Cases 01 and 04 are non-serious and expected. No unexpected reactions were identified.
